

Week of March. 28th

I met with my team to make and prepare the midterm presentation. On Friday we did the midterm presentation. Also, I spoke more about mobile requirements.

Also, I started to design the software architectural pattern that we will use to develop the mobile phone application, and I decided to choose the MVVM which is Model–view–viewmodel. This pattern will keep the mobile app more scalable and will help me to separate the UI codes from business logic codes. This means in the future, we can easily develop, maintain, and add new features without any problem.
